

Sustainable processes for nitrogen removal in WWTPs:

- Sludge return liquor treatment
- Control systems and life cycle analysis

Peter A. Vanrolleghem

Overview

1. The EU-NEPTUNE project
2. Sludge return liquor treatment
3. Process control and LCA
4. Conclusions

Neptune **Structure of the EU NEPTUNE project**

New sustainable concepts and processes for optimisation and upgrading municipal wastewater and sludge treatment

WP 4
Best practice evaluation

WP 1
Upgrading technologies

WP 2
Novel technologies

WP 3
Contaminant and toxicity assessment

WP 5 Dissemination

WP 6 Management and coordination

Evaluation of removal efficiency

Consortium:

- 7 GOs and Universities
- 2 Industry and consulting
- 7 SMEs
- 2 Non-European partners
(Australia + Canada)
- 28 End-users

Budget: € 4.28 mio
(\$ 5.75 mio)

STEQ2012, Québec, QC, Canada, March 14, 2012

Neptune **Sludge return liquor treatment**

Nitrification/Anammox Zürich-Werdhölzli

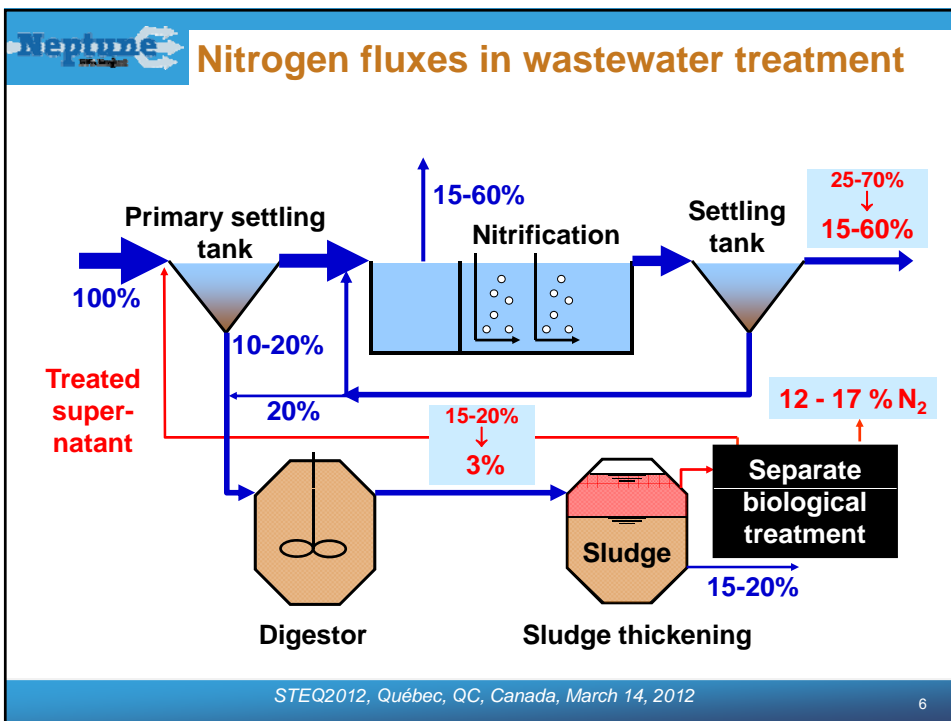

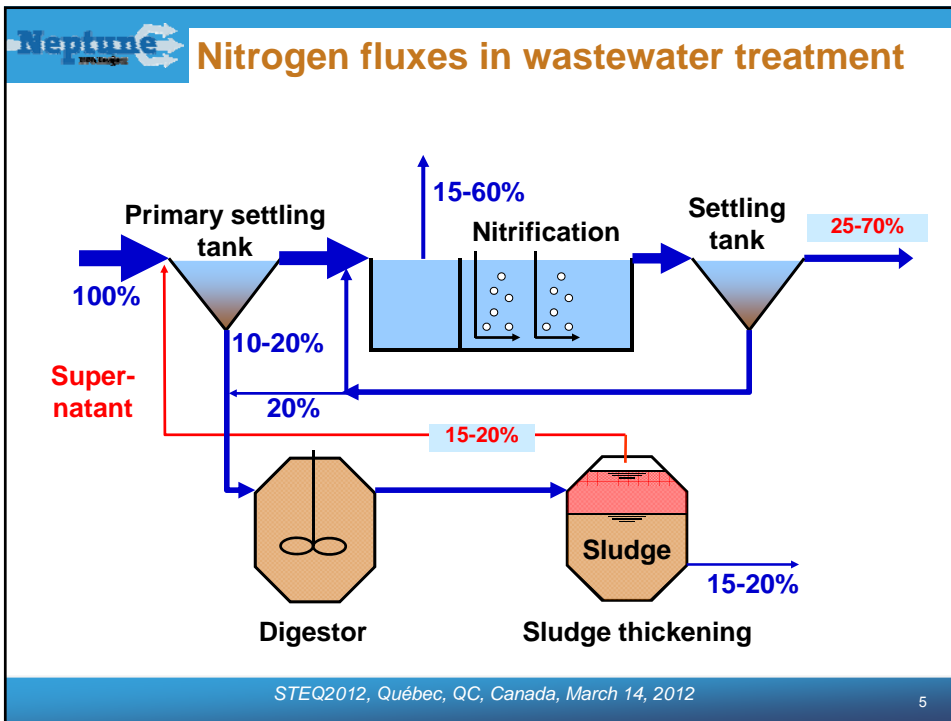

Scope of sludge return liquor treatment

- The process
- Process control
- Greenhouse gas emissions

Conclusion

STEQ2012, Québec, QC, Canada, March 14, 2012

4

Neptune **Nitrogen elimination: conventional or anammox?**

Nitrification

NH_4^+

2O_2 (100%)

NO_3^-

C-Source
(p.E. methanol:
2.2 kg/kgN)

0.5N_2

Denitrification

Partial Nitritation

NH_4^+

0.84O_2
(42%)

Ammonia-ox.

0.55NO_2^-

Nitrite-oxid.

NO_3^-

Anammox

$0.44 \text{N}_2 + 0.12 \text{NO}_3^-$

Anaerobic ammonia oxidation

Advantages of anammox

- No organic carbon addition
- Reduced energy for aeration (58% saving)
- Less excess sludge produced
- Cost saving (1.55 €/kgN_{elimin.} instead of 3.10 €/kgN_{elimin.}) = **50% less**

Disadvantages of anammox

- Sensitive to nitrite, oxygen and ammonia (substrates)
- Slow growth of anammox bacteria + competition with nitrite-oxidizers

STEQ2012, Québec, QC, Canada, March 14, 2012 7

Neptune **Nitritation and anammox combined in a single SBR (sequencing batch reactor)**

1. Fill with supernatant
2. Aeration: partial nitritation
 $\text{NH}_4^+ + 1.5 \text{O}_2 + \rightarrow \text{NO}_2^- + 3 \text{H}_2\text{O}$
3. Stirring: anammox
 $0.45 \text{NH}_4^+ + 0.55 \text{NO}_2^- \rightarrow 0.44 \text{N}_2 + 0.12 \text{NO}_3^-$
4. Sedimentation
5. Discharge

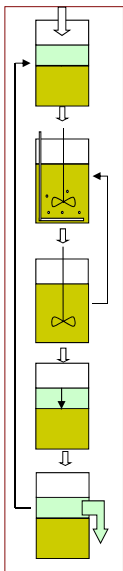

Piloting with a 400L reactor

DEMON®: first single reactor process with pH control
(B. Wett, Water Science & Technology, 2007)

STEQ2012, Québec, QC, Canada, March 14, 2012 8

Neptune WPN, Inc.

Nitrification and anammox combined in a single SBR (sequencing batch reactor)

1. Fill with supernatant
- 2+3 Simultaneous nitrification/anammox

$$\text{NH}_4^+ + 1.5 \text{O}_2 + \rightarrow \text{NO}_2^- + 3 \text{H}_2\text{O}$$

$$0.45 \text{NH}_4^+ + 0.55 \text{NO}_2^- \rightarrow 0.44 \text{N}_2 + 0.12 \text{NO}_3^-$$
4. Sedimentation
5. Discharge

Piloting with a 400L reactor

Neptune WIN Engineering

Control parameters

Crucial

O₂: inhibits anammox bacteria
 ≤0.5 mgO₂/L during aeration
 Substrate for O₂ consumption: always >10 mgNH₄⁺-N/L

NH₃: toxic
 <10 mgNH₃-N/L corresponds to <200 mgNH₄⁺-N/L (pH 7 to 8)

Sedimentation: avoid loss of biomass (bulking)
 Rarely required (start-up): flocculant addition

Nitrite oxidizers: „steal“ NO₂⁻, accumulate NO₃⁻
 Concentration of NO₂⁻ <1 mgNO₂⁻-N/L
 Sludge withdrawal: ≤60 d sludge age

STEQ2012, Québec, QC, Canada, March 14, 2012

12

Neptune **Lower greenhouse gas emission**

Aeration energy: 0.7 kWh/kgO₂

Energy equivalents: 3 kgCO₂/kWh_{electric}

Methanol equivalents: 1.4 kgCO₂/kgMeOH

N₂O equivalents: 310 kgCO₂/kgN₂O

		Conventional Nitrific./Denitr.	Combined Nitrit.-Anammox
O ₂ consumption	kgO ₂ / kg _N elim	4.3	1.9
Aeration energy	kWh / kg _N elim	2.4	1.0
Aeration (CO ₂ equiv.)	kgCO ₂ / kg _N elim	1.4	0.6
Carbon source	kg _{MeOH} / kg _N elim	2.2	-
Carbon source (CO ₂ equ)	kgCO ₂ / kg _N elim	3.1	-
N ₂ O production	gN ₂ O / kg _N elim	0.1 to 17 ⁺	4 ° °
N ₂ O production (CO ₂ equ)	kgCO ₂ / kg _N elim	0 to 5.3	1.2
Total CO₂ equivalents	kgCO₂ / kg_N elim	4.5 to 10	1.8

Conclusion

Combined nitrification/anammox in a single SBR: a robust solution

On-line sensors for process control: O_2 , NH_4^+ , NO_3^-

3 microbial populations are important:

Avoid nitrite oxidation: low $O_2 + NO_2^-$ and sludge wastage

Compared to conventional nitrification/denitrification:

- ...saves half of the costs for N removal
- ...reduces greenhouse impact
- ...allows energy neutral wastewater treatment

Overview

1. The EU-NEPTUNE project
2. Sludge return liquor treatment
3. Process control and LCA
4. Conclusions

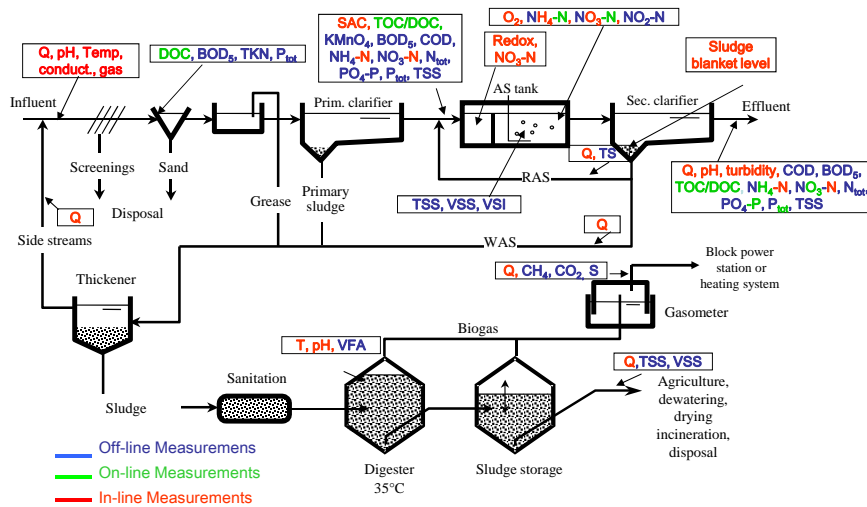

1. Introduction

- ✓ Sensors are installed in WWTPs for monitoring and control purposes

STEQ2012, Québec, QC, Canada, March 14, 2012

1. Introduction

Source: Hansruedi Siegrist

STEQ2012, Québec, QC, Canada, March 14, 2012

1. Introduction

Evolution of number of oxygen, dry matter and turbidity sensors at 220 Aquafin plants
 Source: Aquafin (B)

1. Introduction

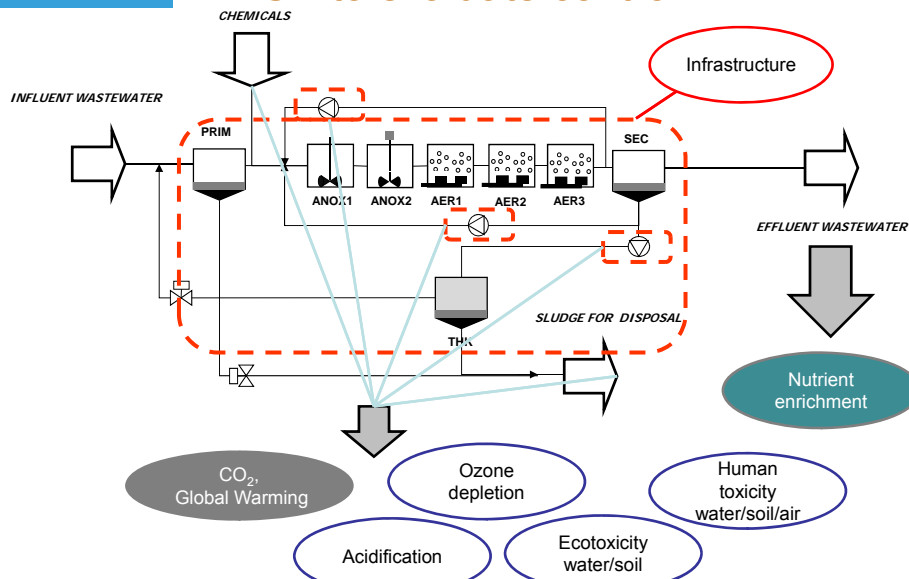

Evolution of the number of nutrient sensors at 220 Aquafin plants
 Source: Aquafin (B)

1. Introduction

- ✓ Driving force: Water Policies
 - ✓ Sustainable development
 - need for tools to estimate GHG emissions and perform Life Cycle Analysis (LCA)
- ✓ Increasing demands on treatment efficiency (new technologies/optimization and control)

2. LCA to evaluate control

2. LCA to evaluate control

- Variables and impact factors

Variables (var)	Impact factors (mPET*year/unit) WF=1
Nitrogen (kg N)	37.23
Phosphorus (kg P)	269.2
Electricity consumption (kWh)	0.12324
Sludge production (kg sludge, 63% water)	0.1
Infrastructure (m ³ influent treated)	0.127
External carbon source (acetate)	3.8781
Metal (FeCl ₃ , 40%)	2.6110

- Functional unit (1m³ of treated wastewater)

- Calculation

$$NIP_{(var)} = \frac{\text{Value}_{(var)} \times IF}{m^3 \text{ treated WW}} \quad \left[\text{mPET} * \text{year} / m^3 \right]$$

- Presentation of the results

- Avoided impact: Influent – effluent nutrient impact
- Induced impact: Effluent nutrient + Electricity + Sludge + Infr + chemicals

2. LCA to evaluate control

DO controller

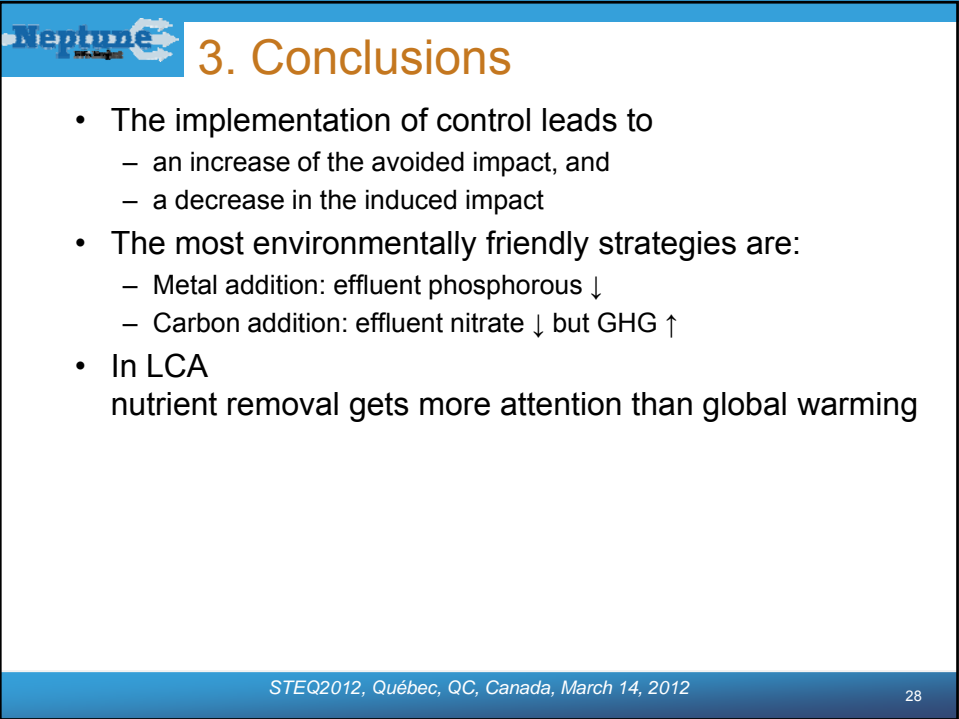

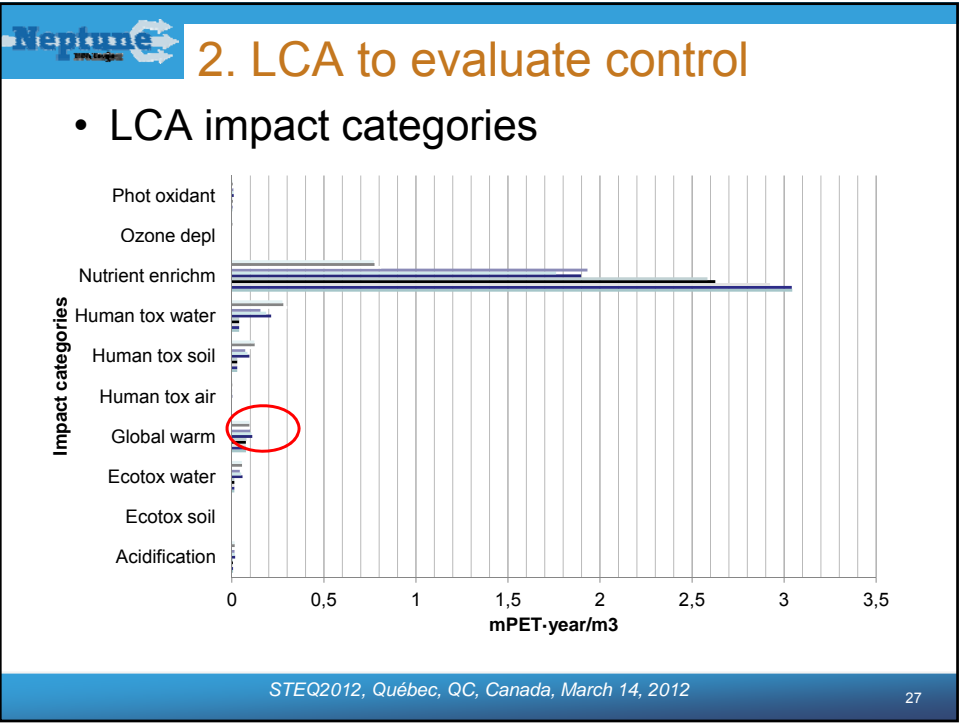

Improve Effluent Quality
Decrease Costs (Aeration)

NO controller

Improve Effluent Quality
Decrease Costs (Pumping)
