Veronique Vandenberghe - 1

Introduction

Monitoring

- For implementation of the EU Water Framework Directive monitoring is an important step for identification/evaluation.
- Models can play a role in every step.
- Hence, also the monitoring needed to build models for evaluation of future pollution abatement scenarios

Introduction

Monitoring problems

- Costly measurements: e.g. BOD, suspended solids, micro-pollutants
- Measurements with wrong frequency, in non-sensitive periods, on wrong places
- Lot of effort needed to maintain large databases
- Intensive measurement campaigns

Objective

- **Calibration of water quality models**
 - **identifiability of the model parameters**
 - **reliability of the model (uncertainty analysis)**
- => depends on good measurements**

**Find an optimal set of sampling data
for the calibration of a water quality model**

ESWAT

Integrated modelling tool

SWAT 98

- Catchment hydrology
- Agricultural pollution
- Constant point sources

ESWAT (van Griensven)

- Hourly time step
(land and river hydrology)
- **River water quality processes**
- Dynamic point sources
- Urban drainage system

Dender case

Dender basin

- 1400 km² catchment
- 50 km long river stretch
- Flemish part modelled
 - heavily polluted
 - sluices for navigation
 - 85% agriculture, 15% urban
 - 300,000 inhabitants (400/km²)

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium

Veronique Vandenberghe - 6

Dender case

Dender basin model

MODEL: 700 km²

- 15 subbasins / 8 tributaries
- 80 HRU's (=combination land use and soil type)
- 10 point source locations
- 8 sluices

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium

Veronique Vandenberghe - 7

Methodology

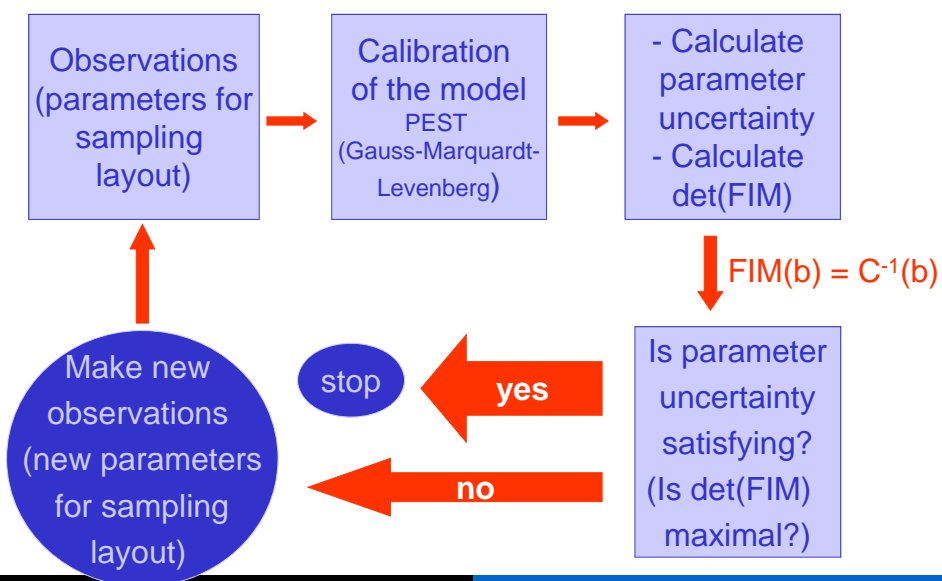

Optimal Experimental Design

- Start with a calibrated model, but with large uncertainty bounds caused by a lack of good measurements to do a good calibration
- Perform virtual experiments (generate time series) with the model for water quality variables of interest
- See where, when, how many measurements/samples are practically and economically feasible and define the parameters of the sampling layout

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium

Veronique Vandenberghe - 8

Methodology

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium

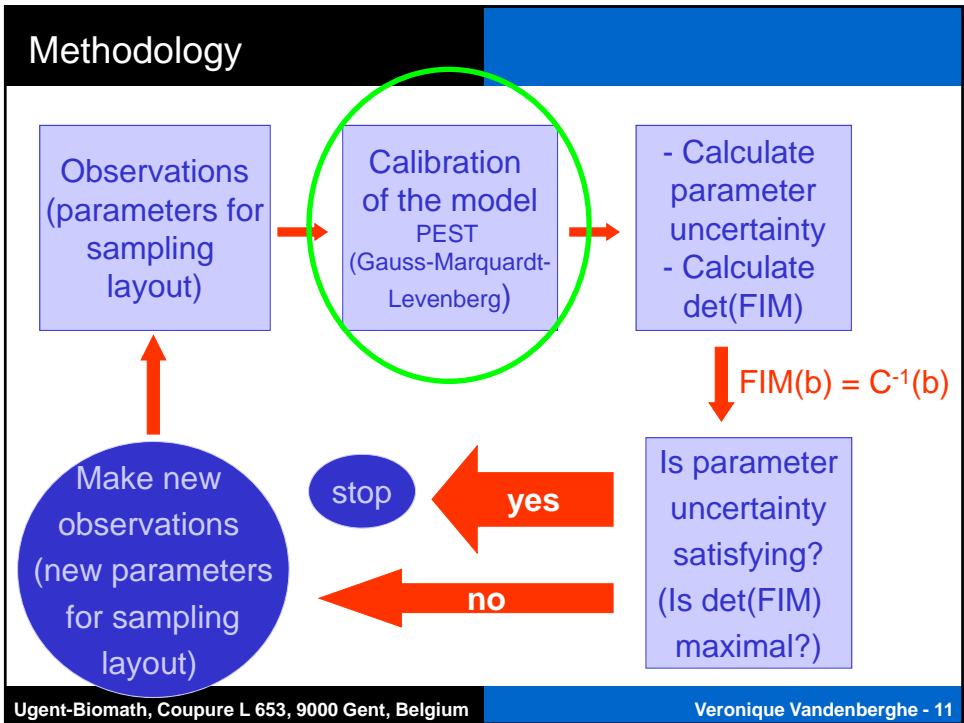

Veronique Vandenberghe - 9

Methodology

Virtual Observations

- **No historic time series of high frequency water quality data available**
- **=> Virtual observation series generated by ESWAT + pseudo-random noise terms**
- **Noise terms: consistent with the accuracy of the measurement devices**
- **Parameters for sampling design: variable, measurement location, frequency, timing**
e.g. every 12 hours, at the mouth + 5km more upstream, from 01/04 till 31/08

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium Veronique Vandenberghe - 10

Methodology

Virtual Calibration

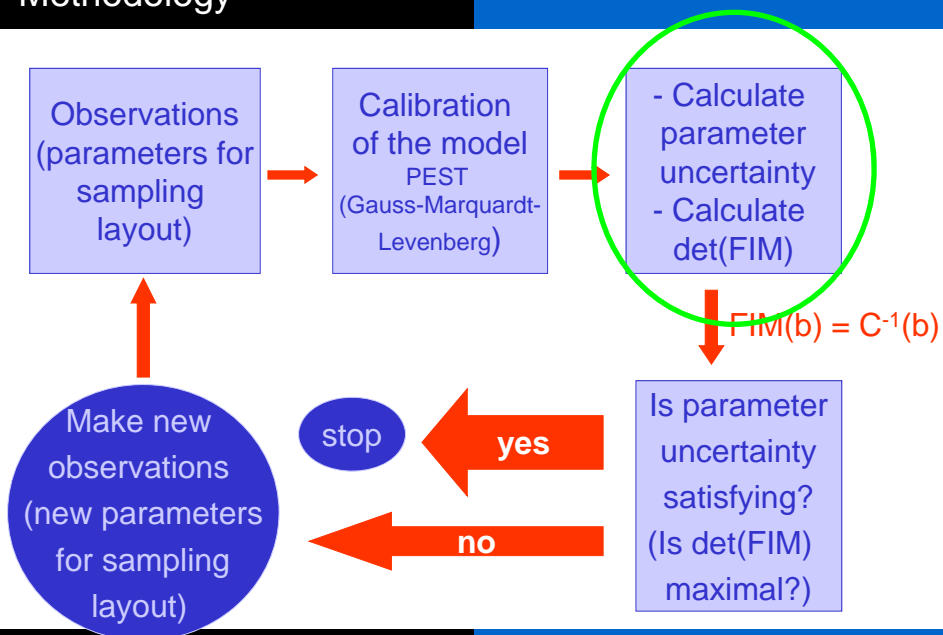

- Start calibration at a point 'close' to the former calibration (to avoid local minima/converge quickly)

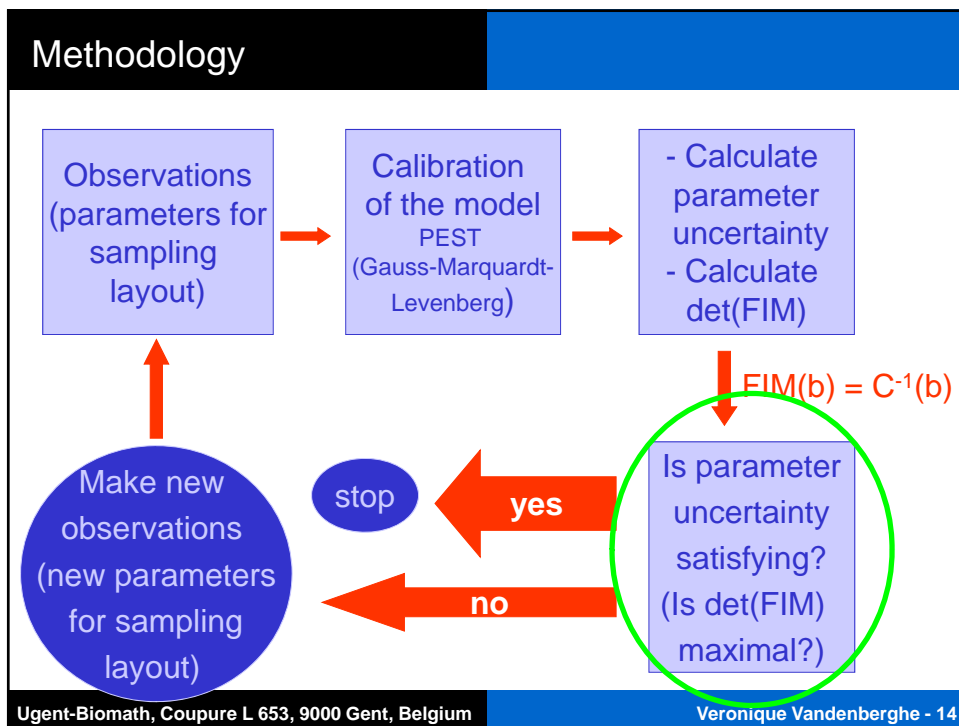

During the calibration the covariance matrix and the uncertainty bounds on the parameters are calculated

- PEST: uses Gauss-Marquardt-Levenberg

Methodology

Methodology

D-optimal design method

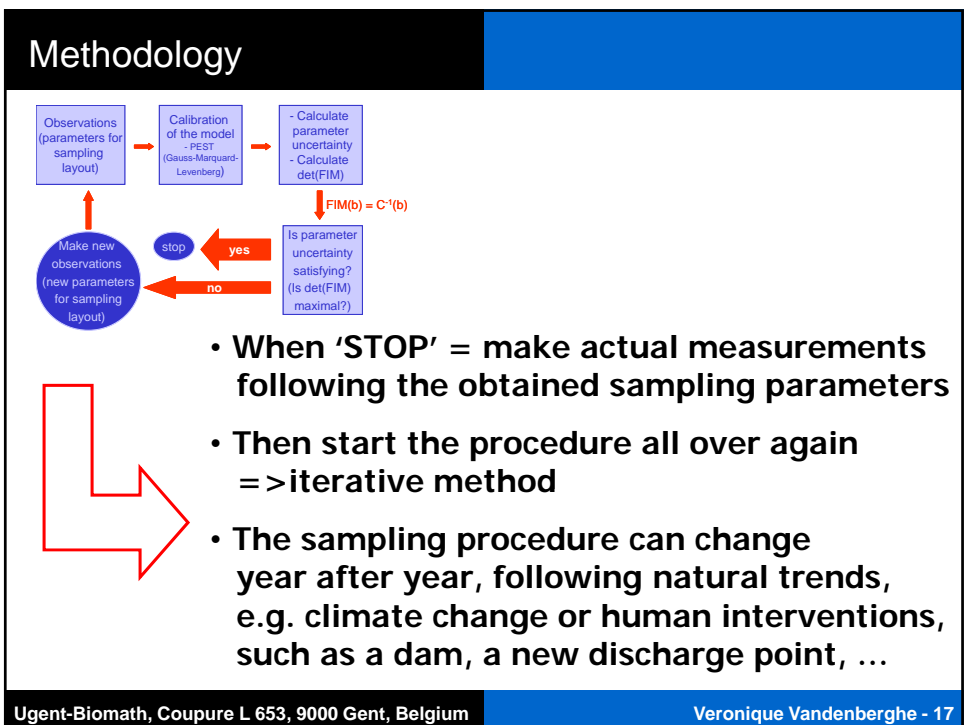

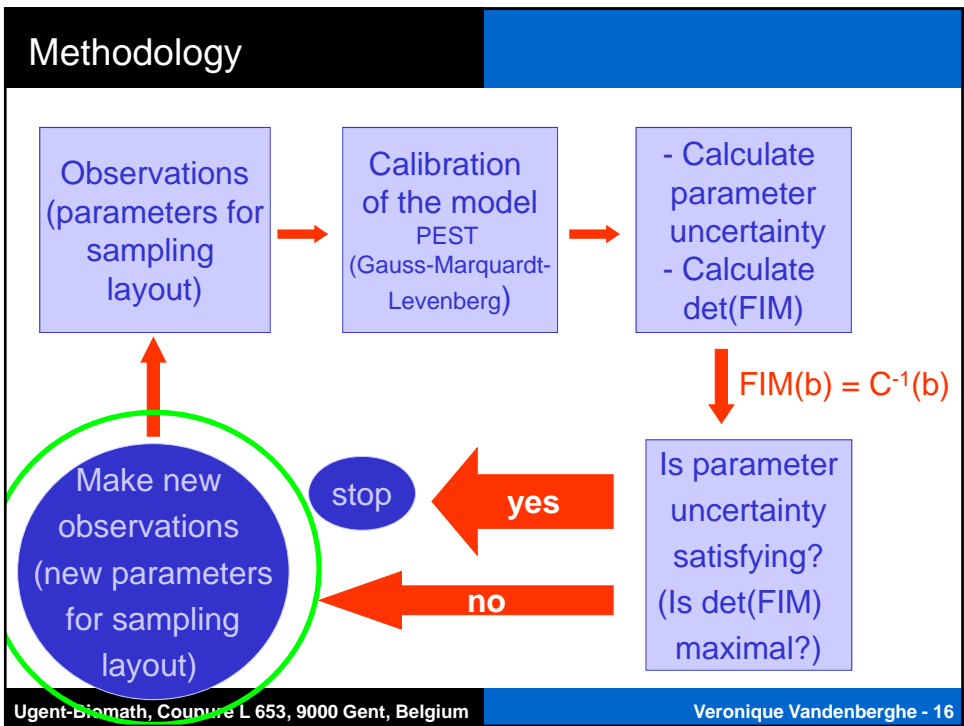

- New measurement layout => with D-optimal design method (= maximisation of Det(FIM))

$$C(b) = \hat{\sigma}^2 (J' Q J)$$

$$\text{Fisher Information Matrix} = C^{-1}(b)$$
- Maximisation of Det(FIM) with shuffled complex technique (SCE-UA method) by changing parameters of sampling layout (frequency, location, timing,...)

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium

Veronique Vandenberghe - 15

Results

OED for Dender basin

Five parameters of the sample layout variable:

- Frequency: every hour - every two days
- Timing: summer, winter, mixed summer-winter
- Total number of samples (365*24)
- Variables: only DO or combined DO-NO₃, DO-NO₃-BOD or DO-NO₃-BOD-NH₄
- Sample location: 4 possible combinations of 3 possible locations: upstream, halfway, downstream

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium

Veronique Vandenberghe - 18

Results

OED for Dender basin

- 635 iterations needed

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium

Veronique Vandenberghe - 19

Results

OED for Dender basin

- **Best** : hourly time base, nearly the whole year, on three locations and with the four variables
- Other sampling schemes provide a quasi similar accuracy
- Some sampling schemes are non-optimal

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium
Veronique Vandenberghe - 20

Results

OED for Dender basin

Non-optimal sampling layouts

Table 1. Non-optimal sampling designs

Sampling interval (h)	Number of samples	Period	Location	Observed variables	Det(FIM)
1	5972	16 Apr.-31 Dec.	Geraardsbergen	DO-NO ₃	4,08E+17
1	5340	22 May-15 Nov.	Geraardsbergen	DO-NO ₃ -BOD	1,19E+19
1	4902	11 May-31 Dec.	Geraardsbergen	DO-NO ₃ -BOD	5,92E+20

- **Factors that are negative for layout:**
 - location: upstream
 - timing: no measurements in spring
 - no NH₄

Ugent-Biomath, Coupure L 653, 9000 Gent, Belgium
Veronique Vandenberghe - 21

Results

OED for Dender basin

Practical considerations

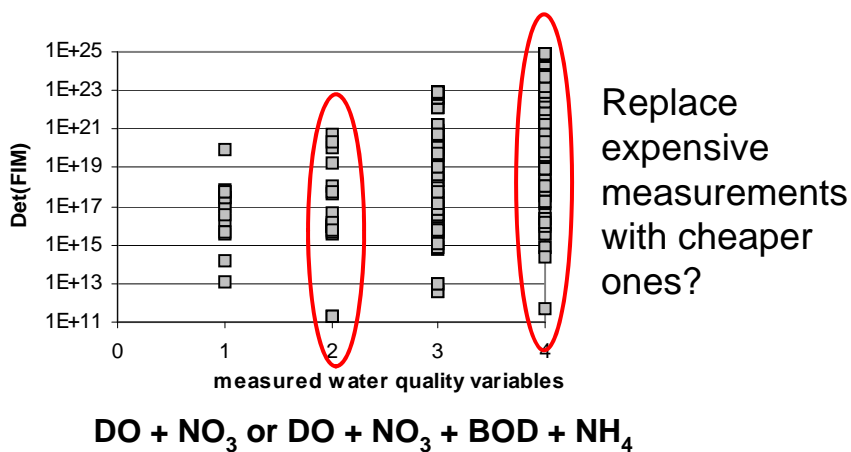

- Final uncertainty on model results is important
=> can be related to cost and practical implications

Results

OED for Dender basin

Practical considerations

Results

OED for Dender basin

Comparison of three sampling schemes

1

2

3

- Average width of the confidence interval around the model results:

- reduction of 45% (2-1)
- reduction of 60% (3-1)

Conclusions

- OED for calibration of water quality models => measurement strategy
- Dender: optimal sampling strategy with
 - highest number of samples,
 - highest sampling frequency,
 - maximum number of locations,
 - maximum number of variables measured.
- Usefulness of the method: evaluation of sub-optimal sampling strategies, in view of limitations, such as costs and practical considerations.
